

Why can't we throw used batteries away?

Many of the things we use in our lives would not be much use without batteries.

There are many types of batteries containing different chemicals. Many of these chemicals are dangerous for people or the environment. They also use up valuable resources.

Rechargeable batteries are great, but even rechargeables eventually need to be replaced.

Recycling batteries means we deal with hazardous chemicals safely, protecting people and the environment.

Recycling also means we can conserve scarce natural resources.
